Title: Perfect score: Sequence: US-09-077-173A-2
1946
1 MASTESSLLRSLGLSPGPGS......CRWAATPQDSSCSTPRADRF 365

Scoring table:

BLOSUM62

Searched: 188963 seqs, 23686106 residues

Database : A_Geneseq_36:*

Word size : 0

Number of hits that pass the threshold : 188963

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA encoding human P2U receptor and null cells receptors - for stimulating or inhibiting grow mammalian cells, and for treating diseases of a mucosa, e.g. asthma.

Disclosure; Page 34: 47pp; English.

The sequence is that of the human P2U receptor. be used to treat diseases of epithelial mucosal enhancing or inhibiting mucus prodn. It may be cystic fibrosis, asthma and chronic bronchitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Figure 1; 56pp; English.

This sequence represents a novel human P2 receptor, P2Y4, which has a preference for pyrimidine binding, especially unfaint triphosphate. This receptor could be used to screen for novel drugs which specifically bind to it. Transgento animals could be used to determine the physiological effects of expressing varying levels of the receptor or to identify novel agonists or antagonists. The agonists and antagonists of human P2Y4 may be used, e.g., in treatment of cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens.         G-protein coupled receptor protein DNA and protein - also methods for isolating (ant)agonists for treatment of cystic fibrosis, incontinence and diabetes
Claim 6; Page 267-68; 360pp; English.
A novel human placenta-derived G-protein coupled receptor protein (G-PCRP) (R91225) was identified as the product of cDNA clone phAH2-17 (T18388). The protein can be obtd. by expression of the cDNA clone in transformed host cells. It was classified as a purinoceptor. G-PCRPs (see also R91217-24 and R91227-33) can be used to screen agonists and antagonists that modulate G-PCRP activity, to raise antibodies and to develop assay systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-AUG-1996 (first entry)

                                                                                                                                                                                                                                                                                                       New isolated human placenta purinergic P-2u receptor (PNR) gene used to develop prods, for the diagnosis and treatment of conditions associated with altered expression of the receptor e.g. inflammation claim 1; Page 27-29; 36pp; English.

W09433 shows a human placenta-derived purinergic P-2u receptor designated PNR. P-2u is specifically expressed in cells active in immunity. An assay for up-regulated expression of PNR can accelerate diagnosis and proper treatment of conditions caused by abnormal signature.
                                                                                                                                                                                                                                 with hypertension, carcinomas, cystic or pathological problems.

                                                                                                                                                                                                                                  partial sequence of the R20 seven transmembrane coding sequence which was later used as a probe for isolating the R20 genomic clone (Q66176) from a human placenta DNA library During the isolation of the R20 gene, two weakly hybridising sequences were identified which had significant homology to other seven transmembrane receptors. The probe was used to screen a human genomic foetal liver DNA library, and while the R20 gene could not be identified ir this library, several weakly hybridising clones were plaque purified, subcloned and sequenced. The two clones were designated R2 (Q66177) and R12. This is the sequence encoded by the R12 clone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A novel human 7-transmembrane receptor (W07617) has been putatively identified as a G-protein thrombin receptor. Its amino acid sequence was deduced from a cDNA clone (T44092) discovered in a human infant brain cDNA library. Recombinant receptor can be produced in host cells (e.g. E. coli, COS-7, Sf9) and used to raise antibodies or to screen for (ant)agonist cpds. Agonists can be used to treat e.g. haemophilia or to promote wound healing; antagonists can be used to treat be used to treat inflammation, angina,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human G-protein thrombin-like receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                            DNA encoding v8 seven transmembrane receptor polypeptide - useful for producing recombinant polypeptide and anti-v28 antibodies, and rin screening assays for v88 agonists and antagonists

Example 10: Columns 87-90: 56pp; English.

The present sequence represents the human R12 protein which is encoded by the full length genomic R12 clone (v18356) which was isolated from the full length genomic DNA library. The invention claims for the full length v28 genomic DNA sequence (v18343) isolated from a human penomic library. The v28 (w48722) and R12 proteins are seven transmembrane (7TM) receptors which are probably involved in signal transduction. The invention also claims that cells transformed with v28 transduction. The invention also claims that cells transformed with v28 anti-v28 antibodies or in screening assays for v28 agonists or antagonists. The antibodies, agonists and antagonists could then be used to modulate v28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo.

                                                                                                                                                                                                                                                                                                      Novel human G-protein coupled receptor GPR4 (W04247) was identified as the product of a CDNA clone (T33905) isolated from a human 12-wk embryo. The protein is also expressed in the human heart, spleen and leukocytes. It shows 82% identity over a 291-amino acid stretch with a chick orphan G-protein coupled receptor. Potential ligands include thrombin, chemokine and platelet activating factor. Recombinant GPR4, GPR1, GPR2 and GPR3 (see also W04244-46) can be expressed in e.g. E. coli, COS or insect cell hosts for use in identifying (ant)agonist cpds. Agonists may be used to treat asthma, Parkinson's disease, hypotension, osteoporosis etc., and antagonists to treat ulcers, asthma, allergies, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human G-protein coupled receptor GPR4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         screening of antagonistic or agonistic compounds

Claim 15; Fig 1; 20pp; English.

Chis represents a human 7-transmembrane receptor, HEBCS41. HEBCS41 is a human G-protein coupled receptor and can be used in vaccines to protect mammals from infections e.g. bacterial, fungal, protozoan and viral infections (especially infections caused by HIV-1 or HIV-2), cancers and Parkinson's disease. They can also be used in the treatment of anorexia, builmia, hypertension, asthma, urinary retension, osteoporosis, ulcers, allergy and neurological disorders. The HBCS41 polypeptides can be used to produce antibodies which are used to treat such infections, isolate polypeptide. The polypeptides can also be used to screen for compounds binding to, activating or inhibiting activation of HEBCS41. They can be used to diagnose diseases and susceptibility to diseases related to sequession or activity of HEBCS41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           78
```

```
A CDNA library from a mouse stomach was constructed in lambda gt10 and screened with a probe encompassing the C140 genomic clone (see 084557). A single phage clone was isolated and cut with EcoRI. The insert was cloned in pBluescript and pSG5 and sequence. The complete nt sequence and deduced AA sequence is given in 084559 & R66992. 5' RACE resulted in the addition of only 27 bps to the 5' end. The S' end of the apparent coding region differs from the 5' end of the ORF of genomic DNA; it is believed that the 5' end of the CDNA sequence is correct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (CORT-) COR THERAPEUTICS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc w01954 represents the murine C140 receptor (C140R). DNA encoding C140R C may be engineered so as to allow the recombinant expression of C140R in 2 suitable host cell, i.e. by removing the native expression-control control sequences and replacing them with control sequences operable in the host. Such a recombinant receptor can be expressed on the surface of cocytes, this provides a good assay system for identifying agonists/antagonists of C140R. The C140 receptor is a G-protein linked receptor and a member cof the "seven-pass" transmembrane receptor superfamily (peptide chain cof the "seven-pass" transmembrane receptor superfamily (peptide chain cof the receptor passes through the cell membrane seven times, producing seven transmembrane regions within the receptor molecule). The C140 creceptor is involved in controlling blood pressure. C140 antagonists (see W01942-W01951) are useful to inhibit signalling from this conversely agonists (see W01914-W01941) of C140 are useful conceptor. resulting in an increase in blood pressure and are therefore useful in pharmaceuticals for the treatment of hypotension (low blood pressure). Conversely agonists (see W01914-W01941) of C140 are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

PT diagnostic applications.

PS Disclosure; Fig 1; 57pp; English.

CC Univ. School of Medicine, St Louis, Missouri) was screened with two CC 32P-labeled oligos corresp. to bp 190-249 and 742-801 of the bovine substance K receptor CDNA. In one of the clones isolated (C140) the hybridising region was localised to a 3.7 kb PstI fragment. This C fragment was subcloned into pBluescript vector. The hybridising and C adjacent regions were sequenced. The nt sequence and the deduced AA C sequence are given in Q84557 & R69920 respectively.

       suitable host cell, i.e. by removing the native expression control sequences and replacing them with control sequences operable in the host. Such a recombinant receptor can be expressed on the surface of cocytes, this provides a good assay system for identifying agonists/antagonists of C140R. The C140 receptor is a G-protein linked receptor and a member of the "seven pass" transmembrane receptor superfamily (peptide chain of the receptor passes through the cell membrane seven times, producing seven transmembrane regions within the receptor molecule). The C140 receptor is involved in controlling blood pressure. C140 antagonists (see W01942-W01951) are useful to inhibit signalling from this receptor, resulting in an increase in blood pressure and are therefore useful in pharmaceuticals for the treatment of hypotension (low blood pressure). Conversely agonists (see W01914-W01941) of C140 are useful
                                                                                                                                                      Vector for expression C140 cell surface receptor in host cell useful to identify C140 agonist and antagonists, which are antihypertensives and elevators of blood pressure, respectively Example 1; Fig lA-B; 60pp; English.
W01952 represents the murine C140 receptor (C140R), including a p signal peptide (see features table). DNA encoding C140R may be engineered so as to allow the recombinant expression of C140R in
                                                                                                                                                                                                                                                            25-JAN-1995; US-390301.

The availability of genomic DNA encoding the mouse protease C140 receptor (see 084557) permitted the retrieval of the corresp. human gene. A human genomic library cloned in the vector EMBL3 was screened using the entire coding region of the murine clone as a probe. The recovered human gene including the DNA sequence and the deduced AA sequence are shown in 084558 & R66921. Subsequent experiments indicated that the human C140 gene is located in the same region of the long arm of chromosome number 5 (5q12-5q13) as has been reported for the human thrombin receptor gene.

                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Haematophagous insect calreticulin protein - used to reduce insect PT infestation and desensitise patients to allergic dermatitis PS Claim 7; Page 71; 86pp; English.

CC Nucleic acid nCtCall209 (T39517) comprises the coding region (minus CC the stop codon) encoding flea calreticulin PCtCal403 (W04171), a CC protein that can be used to alter the blood feeding behaviour of CC haematophagous insects or to desensitise an animal to allergic CC dermatitis. The coding sequence was deduced from a cDNA clone (T39516) isolated from a cDNA library prepd. from the salivary CC glands of Ctenocephalides felis. Calreticulin nucleic acids (see CC also T39515 and T39518-20) can be used to produce recombinant CC against haematophagous insect infestation.

A cDNA clone (T39516), designated nCtCall589, codes for a flea calreticulin protein (W04171) that can be used to alter the blood feeding behaviour of haematophagous insects or to desensitise an animal to allergic dermatitis. Its sequence was deduced from clones nCtCal665, nCtCal750 and nCtCal1218 isolated from a Ctenocephalides felis salivary gland cDNA library by PCR amplification using flea calreticulin gene-specific primers (see also T39529-32). nCtCal1589 and other calreticulin nucleic acids (see also T39515 and T39517-20) can be used to produce recombinant calreticulins, or can be administered to an animal to protect it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Flea calreticulin cDNA crone noccarrativo.

The antisense strand (T39518) of nucleic acid nCtCall589 (T39516) hybridises under stringent conditions to a flea calreticulin gene. nCtCall589 codes for a flea calreticulin protein (W04171) that can be used to alter the blood feeding behaviour of haematophagous insects or to desensitise an animal to allergic dermatitis. The antisense strand, when administered to an animal, reduces calreticulin activity in insects feeding on the animal, thereby reducing the insect burden on the animal and in the environment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1237

PR New isolated human genes and the secreted polypeptide(s) they encode

PT New isolated human genes and tractment of e.g. Cancers, neurological

PT disorders, immune diseases, inflammation or blood disorders

Claim 1; Page 360-361; 721pp; English.

CC This sequence represents a nucleic acid molecule designated Gene 126 from

CC This sequence represents a nucleic acid molecule designated Gene 126 from

CC 209048) which encodes a secreted human protein. The gene can be used to

generate fusion proteins by linking to the gene to a human immunoglobulin

CC generate fusion proteins by linking to the gene to a human immunoglobulin

CC portion (e.g. V5950) for increasing the stability of the fused

CC portion (e.g. V5950) for increasing the stability of the fused

CC protein as compared to the human protein only.

CC acid sequences: V59511-V59812; annino acid sequences W74731-W75026) which

CC are useful for preventing, treating or ameliorating "medical conditions can be

CC diagnosed by determining the amount of the new polypeptides in a sample

CC specific uses are described for each of the 186 polynucleotides, based on

which tissues they are most highly expressed in (see V59511 for described

CC uses).

                                                              This sequence represents the complete genome sequence of the non-M (major), non-O (Outlier) HIV-1 strain YBF30 (CNCM I-1753), isolated from the Cameroon. The HIV strain, peptides, antibodies and oligonucleotides derived from it (see Y60752-Y60798 and W68473-W68482) are used for diagnosis of or immunisation against non-M, non-O HIV-1 infections. The oligonucleotides, peptides and antibodies can also be used for

This sequence encodes the Fanconi anaemia of compleme (FA-A) protein of the invention. The DNA's may be use genetic defect in a cell (especially the FA-A gene). used for screening (especially prenatal FA-A), detect and FA-A disease diagnosis.

This sequence represents the gag gene from the non-M (major), non-O (Outlier) HIV-1 strain YBF30 (CNCM I-1753), isolated from the Cameroon. The HIV strain (see V60751 for complete genome), peptides, antibodies a oligonucleotides derived from it (see V60752-V60798 and W68473-W68482) are used for diagnosis of or immunisation against non-M, non-O HIV-1 infections. The oligonucleotides, peptides and antibodies can also be used for typing HIV strains.

Example 18; Fig 3, 19pp; English.

A cDNA clone (T18995) codes for Bv60, a 60 kDa immunoreactive protein (R97981) located on the surface of Babesia bovis merozoites. It was isolated from a blood-stage B. bovis cDNA library in lambda ZAPII by subcloning into Bluescript SK(-) and immunoscreening using monospecific anti-Bv60 antisera. Bv60, Bo44 and Bv42 (see also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence encodes an immunoreactive epitope located on the surface of babesia bovis merozoites. A. B. bovis cDNA expression library was constructed using poly A(+) RNA isolated from B. bovis infected blood cultures. Plaques were immunoscreened using rabbit anti-Bv60 sera, and positive plaques tested for reactivity with monoclonal antibodies that recognised a Bv42 surface exposed epitope as well as an isotype control monoclonal antibody and normal rabbit serum. Lambda rBv60 phagemid DNA was isolated from bacteria, and then restriction digested.

                                                                                                                                                                  PT disorders, immune diseases, inflammation or blood disorders and control of the invention describes novel isolated human secreted proteins and CC their encoding nucleic acid sequences. The products of the invention CC are useful for preventing, treating or ameliorating medical conditions CC e.g. by protein or gene therapy. Also pathological conditions can be CC diagnosed by determining the presence or amount of expression of CC absence of mutations in the new polymcleotides. Specific uses are CC described for each of the 70 polymcleotides, based on which tissues they CC are most highly expressed in, and include developing products for the CC disorders developmental abnormalities and foetal deficiencies, blood CC disorders, leukemias, diseases of the immune system, autoimmune diseases, the patic and renal disease, lymphomas, inflammation, altergies, asthma, CC sepsis, diabetes, Althemer's and cognitive disorders, schizophrenia, osteoporosis, arthritis, psoriasis, dispestive/endocrine disorders. CC infections and AIDS. The human secreted proteins of the invention are represented in x37369-x37441.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8888888888
                                                                                                                                             Claim 1; page 1487; 2245pp; Japanese.

CR single-stranded DNA (or its complementary strand or the corresp. CO while-stranded DNA (or its comprises one of the 7837 "GS" sequences of couble-stranded DNA, which comprises one of the 7837 "GS" sequences coupled in T19001-T28837 and which is able to hybridise to part of the following persons of the following the following the GS (dene Signature) sequences were obtained from 3'-directed cDNA libraries prepared coupled from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(") as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library can be constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

SD-7 and other E6-BP-encoding clones (see T08636-41) were identified using a two-hybrid assay in which yeast expressing the HPV-16 E6 gene fused to the BBV E2 DNA-binding domain was transformed with a vector carrying HeLa cDNA and a VP16 transcription activation domain. These novel cDNA clones (deposited as a library of pR3306 plasmids as ATCC 75827) are used to produce recombinant E6-BPs in host cells, as primers or probes e.g. to detect genetic lesions, to raise transgenic animals, and in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T23922 standard; T23922;
                                                                                                                                                                                                                                                                                                                                                                                                                                               tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying gene signatures in 3'-directed human cDNA library -
for diagnosis of abnormal cell function, by preparing cDNA that
reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 95-206931/27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   world. Half of the world popularion sprains in the inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density riters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          169

PT Polyniclectide(s) and proteins derived from Staphylococcus aureus - PT stored on computer readable medium and used in the production of PT anti-s. aureus vaccines
PS Claim 1; Page 620-622; 3271pp; English.

CC of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access comemory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are CC likely to encode antigens have been identified and these polypeptides can composition against S.aureus infection. The CC saureus in a sample. S.aureus is implicated in numerous human diseases, CC including cellulitis, eyelid infections, food polsoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (C computer readable medium.

A 2.9 kb HindIII fragment from pND859 of Lactococcus lactis var. diacetylactis VK 12922 includes a sequence (T26895) coding for an Abi (abortive infection mechanism) bacteriophage resistance determinant (R95450). Plasmid pND859 can be conjugatively transferred to lactococcal recipients where it confers insensitivity to phage infection and resistance to cadmium. It was isolated by filter-mate conjugation. pND859 or the Abi determinant can be used to impart, or to increase, the phage resistance of lactic acid bacteria used in food processing.
